

Project Design phase II

Third Party API

Date	02 Nov 2023
Team Id	6CA770FDBD1BFD488A34FCBDBFC19CE7
Project name	Creation of an application for school management

Define a third party API:

A third-party app, also known as a third-party application or simply a "third-party app," is software developed by an independent, external entity or developer, rather than the organization or platform that owns the operating system or ecosystem on which the app is intended to run. These apps are not directly created or maintained by the company or entity that produces the underlying operating system, hardware, or platform.

For example, in the context of mobile devices, a third-party app refers to any application that is not developed by the manufacturer or operating system provider but is instead created by a separate developer or software company. These apps can be downloaded and installed on the device through an app store, such as the Apple App Store or Google Play Store.

Third-party apps extend the functionality of a platform or system, providing users with a wide range of additional features, services, or entertainment options. They cover various categories, including productivity, communication, social networking, gaming, and more. Users can choose from a plethora of third-party apps to personalize.

API Architecture:
