

## Project Design Phase II

### Technical Architecture

Date	02 Nov 2023
Team id	6CA770FDBD1BFD488A34FCBDBFC19CE7
Project name	Creation of an application for school management

#### Define Technical Architecture:

Technical architecture, also known as system or technology architecture, is a structured framework that outlines the high-level design and structure of a complex technology system or application. It defines the various components, their interactions, and the principles and guidelines governing their design and integration. Technical architecture is a critical aspect of any IT project, as it provides a blueprint for implementing and managing technology solutions. Technical architecture plays a crucial role in ensuring that a technology solution is designed to meet the functional and non-functional requirements of a project, is scalable, secure, and maintainable, and can effectively integrate with other systems. It serves as a reference for developers, system administrators, and other stakeholders throughout the project's lifecycle.

#### Technical Architecture:
